## Introduction

SolidProof.io is a brand of the officially registered company MAKE Network GmbH, based in Germany. We're mainly focused on Blockchain Security such as Smart Contract Audits and KYC verification for project teams.

Solidproof.io assess potential security issues in the smart contracts implementations, review for potential inconsistencies between the code base and the whitepaper/documentation, and provide suggestions for improvement.

## Disclaimer

SolidProof.io reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of the security or functionality of the technology we agree to analyze.

# Project Overview

## Summary

<b>Project Name</b>	LemonX Trade
<b>Website</b>	<a href="https://www.lemonx.trade/">https://www.lemonx.trade/</a>
<b>About the project</b>	LemonX combines the essentials of perpetual trading, offering upto 50x leverage, deep liquidity, and the lowest fees, all wrapped up in a platform that operates at lightning speed.
<b>Chain</b>	Core
<b>Language</b>	Solidity
<b>Codebase</b>	<a href="https://github.com/lemonx-trade/contracts">https://github.com/lemonx-trade/contracts</a>
<b>Forked Status</b>	This project is inspired from GMX contract; here is the link to the contracts: <a href="https://github.com/gmx-io/gmx-contracts/tree/master/contracts">https://github.com/gmx-io/gmx-contracts/tree/master/contracts</a>
<b>Commit</b>	N/A
<b>Unit Tests</b>	Not Provided

## Audit Summary

Version	Delivery Date	Change Log
v1.0	04. August 2024	<ul style="list-style-type: none"><li>· Layout Project</li><li>· Automated/ Manual-Security Testing</li><li>· Summary</li></ul>
v1.1	28. August 2024	<ul style="list-style-type: none"><li>· Reaudit</li></ul>

**Note** – The following audit report presents a comprehensive security analysis of the smart contract utilized in the project that includes outside manipulation of the contract's functions in a malicious way. This analysis did not include functional testing (or unit testing) of the contract/s logic. We cannot guarantee 100% logical correctness of the contract as we did not functionally test it. This includes internal calculations in the formulae used in the contract.

## File Overview

The Team provided us with the files that should be tested in the security assessment. This audit covered the following files listed below with an SHA-1 Hash.

File Name	SHA-1 Hash
contracts\core\BaseOrderManager.sol	e2f4eadc523766b650b8e19c887005aec597590a

File Name	SHA-1 Hash
contracts\core\interfaces\ITimeLock.sol	8e2d78aaebdfcfe5e7b6029470884ff29a0e2fed
contracts\core\interfaces\ITierBasedTradingFees.sol	6494b1f198fa0622acab69e71bfaab56d2f71818

*Please note: Files with a different hash value than in this table have been modified after the security check, either intentionally or unintentionally. A different hash value may (but need not) be an indication of a changed state or potential vulnerability that was not the subject of this scan.*

## Imported packages.

*Used code from other Frameworks/Smart Contracts.*

Dependency / Import Path	Count
pyth-sdk-solidity/IPyth.sol	2
pyth-sdk-solidity/PythStructs.sol	2

**Note for Investors:** We only audited contracts mentioned in the scope above. All contracts related to the project apart from that are not a part of the audit, and we cannot comment on its security and are not responsible for it in any way. This project is inspired by the GMX contract structure, and the issues that are related to the GMX project will remain the same in the contract. So it is recommended that you do your own research.

## External/Public functions

*External/public functions are functions that can be called from outside of a contract, i.e., they can be accessed by other contracts or external accounts on the blockchain. These functions are specified using the function declaration's external or public visibility modifier.*

## State variables

*State variables are variables that are stored on the blockchain as part of the contract's state. They are declared at the contract level and can be accessed and modified by any function within the contract. State variables can be needed within visibility modifier, such as public, private or internal, which determines the access level of the variable.*

## Components

 Contracts	 Libraries	 Interfaces	 Abstract
21	5	24	1

## Exposed Functions

*This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.*

 Public	 Payable			
548	14			
External	Internal	Private	Pure	View
439	495	54	19	242

## StateVariables

Total	 Public
246	239

## Capabilities

Solidity Versions observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts	
0.8.19	-----	Yes	yes (6 asm blocks)	-----	
Transfer s ETH	Low-Level Calls	Delegate Call	Uses Hash Functions	ECRecover	New/Create/Create2
yes		yes	yes		

## Inheritance Graph

An inheritance graph is a graphical representation of the inheritance hierarchy among contracts. In object-oriented programming, inheritance is a mechanism that allows one class (or contract, in the case of Solidity) to inherit properties and methods from another class. It shows the relationships between different contracts and how they are related to each other through inheritance.

# Audit Information

## Vulnerability & Risk Level

Risk represents the probability that a certain source threat will exploit the vulnerability and the impact of that event on the organization or system. The risk level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 - 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 - 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 - 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 - 1.9	A vulnerability that has informational character but is not affecting any of the code.	An observation that does not determine a level of risk

## Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to check the repository for security-related issues, code quality, and compliance with specifications and best practices. To this end, our team of experienced pen-testers and smart contract developers reviewed the code line by line and documented any issues discovered.

We check every file manually. We use automated tools only so that they help us achieve faster and better results.

## Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - a. Reviewing the specifications, sources, and instructions provided to SolidProof to ensure we understand the size, scope, and functionality of the smart contract.
  - b. Manual review of the code, i.e., reading the source code line by line to identify potential vulnerabilities.
  - c. Comparison to the specification, i.e., verifying that the code does what is described in the specifications, sources, and instructions provided to SolidProof.
2. Testing and automated analysis that includes the following:
  - a. Test coverage analysis determines whether test cases cover code and how much code is executed when those test cases are executed.
  - b. Symbolic execution, which is analysing a program to determine what inputs cause each part of a program to execute.
3. Review best practices, i.e., review smart contracts to improve efficiency, effectiveness, clarity, maintainability, security, and control based on best practices, recommendations, and research from industry and academia.
4. Concrete, itemized and actionable recommendations to help you secure your smart contracts.

## Overall Security Upgradeability

### Contract is not an upgradable

 Deployer cannot update the contract with new functionalities.

Description	The contract is not an upgradeable contract. The Deployer is not able to change or add any functionalities to the contract after deploying.
Comment	N/A

## Ownership

**Contract ownership is not renounced.**

 **The ownership is not renounced.**

Description

The owner has not renounced the ownership that means that the owner retains control over the contract's operations, including the ability to execute functions that may impact the contract's users or stakeholders. This can lead to several potential issues, including:

- Centralizations
- The owner has significant control over contract's operations.

Comment

N/A

**Note** – *The contract cannot be considered as renounced till it is not deployed or having some functionality that can change the state of the contract.*

## Ownership Privileges

These functions can be dangerous. Please note that abuse can lead to financial loss. We have a guide where you can learn more about these Functions.

### Minting tokens

Minting tokens refer to the process of creating new tokens in a cryptocurrency or blockchain network. This process is typically performed by the project's owner or designated authority, who has the ability to add new tokens to the network's total supply.

**Contract owner can mint new tokens.**

**✗ The owner can mint new tokens.**

#### Description

The contract allows the governor to mint new tokens, which can provide flexibility for specific scenarios. However, to maintain the stability and reliability of the token's supply, it is recommended to introduce a maximum threshold for minting. By setting a clear upper limit, the contract can prevent excessive token creation, thereby safeguarding the token's value and ensuring fair treatment of all participants. This approach helps maintain confidence in the token's overall supply and preserves the interests of the entire community.

#### Comment

This functionality is a core component of the business logic, as it defines the essential operations and processes that directly support the application's key business objectives.

### File/Line(s): L24-26

Codebase: MintableBaseToken.sol

```
trace funcsig
function mint(address _account, uint256 _amount) external override onlyMinter {
    _mint(_account, _amount);
}
```

### File/Line(s): L28-30

Codebase: USDL.sol

```
trace funcsig
function mint(address _account, uint256 _amount) external override onlyVault {
    _mint(_account, _amount);
}
```

## Burning tokens

*Burning tokens is the process of permanently destroying a certain number of tokens, reducing the total supply of a cryptocurrency or token. This is usually done to increase the value of the remaining tokens, as the reduced supply can create scarcity and potentially drive up demand.*

### Contract owner can burn tokens

**The owner can burn tokens.**

#### Description

The contract includes a feature that allows the owner to burn tokens from any wallet, which could be useful for administrative tasks. However, to maintain trust and transparency, it is advisable to enhance this functionality by ensuring that any token burning is limited to cases where explicit user consent or allowance has been provided. Implementing these safeguards would align with best practices for protecting user assets and ensuring the secure operation of the contract.

#### Comment

This functionality is a core component of the business logic, as it defines the essential operations and processes that directly support the application's key business objectives.

### File/Line(s): L32-34

### Codebase: USDL.sol

```
ftrace | funcSig
function burn(address _account↑, uint256 _amount↑) external override onlyVault {
|   _burn(_account↑, _amount↑);
}
```

### File/Line(s): L28-30

### Codebase: MintableBaseToken.sol

```
ftrace | funcSig
function burn(address _account↑, uint256 _amount↑) external override onlyMinter {
|   _burn(_account↑, _amount↑);
}
```

## Blacklist addresses

*Blacklisting addresses in smart contracts is the process of adding a certain address to a blacklist, effectively preventing them from accessing or participating in certain functionalities or transactions within the contract. This can be useful in preventing fraudulent or malicious activities, such as hacking attempts or money laundering.*

**Contract owner cannot blacklist addresses.**

 **The owner cannot blacklist wallets.**

Description	The owner cannot blacklist wallets from transferring of tokens.
Comment	N/A

## Fees and Tax

*In some smart contracts, the owner or creator of the contract can set fees for certain actions or operations within the contract. These fees can be used to cover the cost of running the contract, such as paying for gas fees or compensating the contract's owner for their time and effort in developing and maintaining the contract.*

**Contract owner can levy high taxes**

 **The owner can set fees more than 25%.**

Description

The contract has a functionality that permits the governor to adjust the fees as needed. However, it is strongly recommended to implement a reasonable cap, ideally not exceeding 25%, to ensure the fees remain within acceptable limits. This approach helps maintain fairness and transparency, preventing any scenario where fees could be set excessively high, which may not be in the best interest of all parties involved.

Comment

This functionality is a core component of the business logic, as it defines the essential operations and processes that directly support the application's key business objectives.

## Lock User Funds

In a smart contract, locking refers to the process of restricting access to certain tokens or assets for a specified period of time. When token or assets are locked in a smart contract, they cannot be transferred or used until the lock-up period has expired or certain conditions have been met.

### Contract owner can lock function.

The owner can lock function.

Description	The contract contains functionality in which the contract's admin can cease trading and liquidation activity in the vault contract for an indefinite period of time. This is not recommended as it can lock the contract permanently, and there is no time limit in which the trading and liquidity activity will auto-enable. There must be functionality in which the trading and liquidation activity cannot be locked up indefinitely.
Comment	This functionality is a part of the business logic, this functionality underpins the essential operations required to meet the application's critical business requirements, providing a structured framework for achieving the desired outcomes

## Centralization Privileges

Centralization can arise when one or more parties have privileged access or control over the contract's functionality, data, or decision-making. This can occur, for example, if the contract is controlled by a single entity or if certain participants have special permissions or abilities that others do not.

In the project, there are authorities that have access to the following functions:

File	Privileges
<b>Governable</b>	<ul style="list-style-type: none"><li>➤ The governor can update the governor's address.</li></ul>
<b>BaseOrderManager</b>	<ul style="list-style-type: none"><li>➤ The admin can update the admin, vault, and utils address to any arbitrary address including zero.</li><li>➤ The admin can set any arbitrary value in the deposit fees in the contract.</li><li>➤ The admin can withdraw fees from the contract.</li></ul>
<b>LLPManager</b>	<ul style="list-style-type: none"><li>➤ The governor can update the utils contract address.</li><li>➤ The governor can add/remove the handler from the contract.</li><li>➤ The governor can whitelist/un-whitelist tokens in the contract.</li><li>➤ The governor can update any arbitrary amount in the max pool value in the contract.</li><li>➤ The owner can update the cool-down duration period to not more than 48 hours.</li><li>➤ The owner can update any arbitrary address as the vault, usdl, and llp contract address.</li><li>➤ The handler in the contract can add/remove liquidity for the account if the LP activity is not disabled by the governor.</li></ul>
<b>Multicall</b>	<ul style="list-style-type: none"><li>➤ The governor can whitelist addresses to aggregate and cancel orders.</li><li>➤ The whitelisted addresses can aggregate and cancel orders in bulk.</li></ul>
<b>OrderManager</b>	<ul style="list-style-type: none"><li>➤ The admin can update any arbitrary amount in the minimum purchase USD amount market and limit order.</li><li>➤ The admin can update the position keeper in the contract.</li><li>➤ The admin can update the max TP multiplier amount</li></ul>

<b>Pricefeed</b>	<ul style="list-style-type: none"><li>➤ to any arbitrary amount.</li><li>➤ The admin can update any arbitrary amount in the min execution fee increase/decrease market and limit order value.</li><li>➤ The admin can update any arbitrary address as the price feed contract address.</li><li>➤ The admin can update the minimum block delay keeper, time delay, and max time delay to any arbitrary value.</li><li>➤ The admin can add/remove order keepers, and liquidators in the contract.</li><li>➤ The position keeper can increase/decrease positions in the contract.</li><li>➤ The admin can withdraw stuck tokens from the contract.</li><li>➤ The order keeper can execute orders in the contract.</li><li>➤ The liquidator can liquidate multiple positions in the contract.</li></ul>
<b>PythPriceFeed</b>	<ul style="list-style-type: none"><li>➤ The governor can update the order manager, and reward router contract address.</li><li>➤ The governor can add/remove updaters in the contract.</li><li>➤ The governor can add any arbitrary amount in the max allowed delay, max allowed delta, and slippage value in the contract.</li><li>➤ The governor can add price lds to the tokens.</li><li>➤ The updater can set prices and execute orders in the contract.</li><li>➤ The updater can execute positions and orders in the contract.</li><li>➤ The updater can liquidate the position from the contract.</li><li>➤ The governor can withdraw funds from the contract.</li><li>➤ The updater can execute the LP requests from the contract.</li></ul> <ul style="list-style-type: none"><li>➤ The governor can update the order manager, and reward router contract address.</li><li>➤ The governor can add/remove updaters in the contract.</li><li>➤ The governor can update the pyth contract address.</li></ul>

- to any arbitrary amount.
  - The admin can update any arbitrary amount in the min execution fee increase/decrease market and limit order value.
  - The admin can update any arbitrary address as the price feed contract address.
  - The admin can update the minimum block delay keeper, time delay, and max time delay to any arbitrary value.
  - The admin can add/remove order keepers, and liquidators in the contract.
  - The position keeper can increase/decrease positions in the contract.
  - The admin can withdraw stuck tokens from the contract.
  - The order keeper can execute orders in the contract.
  - The liquidator can liquidate multiple positions in the contract.
- 
- The governor can update the order manager, and reward router contract address.
  - The governor can add/remove updaters in the contract.
  - The governor can add any arbitrary amount in the max allowed delay, max allowed delta, and slippage value in the contract.
  - The governor can add price lds to the tokens.
  - The updater can set prices and execute orders in the contract.
  - The updater can execute positions and orders in the contract.
  - The updater can liquidate the position from the contract.
  - The governor can withdraw funds from the contract.
  - The updater can execute the LP requests from the contract.
- 
- The governor can update the order manager, and reward router contract address.
  - The governor can add/remove updaters in the contract.
  - The governor can update the pyth contract address.

<b>ReaderCache</b>
<b>ReaderContract</b>
<b>RewardRouter</b>
<b>RewardTracker</b>
<b>TierBasedTradingFees</b>

- The governor can add any arbitrary amount in the max allowed delay, and max allowed delta value in the contract.
- The updater can set prices and execute orders in the contract.
- The updater can execute positions and orders in the contract.
- The updater can liquidate the position from the contract.
- The governor can withdraw funds from the contract.
- The updater can execute the LP requests from the contract.
- The governor can update the vault, utils, reader, LLP, and FLLP contract address.
- The governor can update the Tier1, Tier2, Tier3, Tier1 factor, Tier2 factor, Tier3 factor.
- The governor can update the tier borrowing rate factor, funding factor for less and high OI side, Tier borrowing rate start time.
- The governor can update the vault, utils and USDC contract address.
- The governor can update the feeLLptracker, LLP manager, LLP contract address.
- The governor can update the minimum execution fees in the contract.
- The governor can add/remove keepers in the contract.
- The governor can withdraw tokens from the contract.
- The keeper can execute the mint and burn requests.
- The governor can initialize the contract only once.
- The governor can add/remove the depositing token.
- The governor can update any arbitrary amount in the reward precision.
- The governor can add/remove the handler from the contract.
- The governor can update any arbitrary amount in the cumulative reward per Lptokens value in the contract.
- The governor can withdraw tokens from the contract.
- The handler can stake/un-stake tokens for accounts.
- The governor can add/remove the tier updater in the contract.

## Timelock

- The tier updater can update the tier-based trading basis points for the trader.
- The admin can update the admin address.
- The admin can update the admin of other contract addresses.
- The admin can add/remove the contract handler.
- The admin can add/remove the keepers in the contract.
- The admin can update the buffer period in the contract to not more than 5 days.
- The admin can update the max leverage to not less than 500000.
- The keepers and admin update the max borrowing and funding rate factor to not more than 0.02%.
- The keepers and admins can update the token configuration in the contract in which the minimum profit BPS is set to 0.05%.
- The keeper and admin can mint and burn the tokens in the USDL contract.
- The admin can update the cool-down duration to not more than 2 hours.
- The admin can update the max global long, and short size in the vault contract.
- The admin can remove the admin from the yield token contract.
- The admin can update the utils in the vault contract.
- The admin can update the max gas price to not more than 5000000000 value in the vault contract.
- The admin can withdraw fees from the vault contract.
- The keepers and admins can withdraw fees from the vault contract in bulk.
- The admin can enable/disable the private liquidation mode in the vault contract.
- The admin can add a liquidator to the vault contract.
- The admin can transfer tokens to the contract address from other wallets.
- The admin can approve the spender to transfer tokens.
- The admin can signal to withdraw tokens from the contract.
- The admin can signal to update the governor in the

<b>USDL</b>
<b>Utils</b>
<b>Vault</b>

contract.

- The admin can signal to update the handler in the contract.
- The admin can signal to update the price feed and update the price fees in the vault contract.
- The admin can signal to redeem USDL and redeem the USDL amount from the vault contract.
- The admin can update the configurations in the vault contract.
- The admin can cease the trading activity for an indefinite period of time.
- The admin can disable the LP activity in the contract for an indefinite period of time.
- The admin can clear all the ongoing actions in the contract.
- The governor can add/remove the vault in the contract.
- The vault contract can mint and burn an unlimited number of tokens from the contract.
- The governor can update tier1, tier2, and tier3 size in the contract.
- The governor can update the tier1factor, tier2factor, and tier3factor in the contract.
- The governor can update the tier borrowing rate factor to any arbitrary amount.
- The governor can update the funding factor for the less and high OI sides in the contract.
- The governor can update the tier-based trading fees contract address.
- The governor can update the vault, and price feed contract address.
- The governor can update the borrowing rate and funding rate precision in the contract.
- The governor can update the borrowing rate start time in the contract.
- The governor can update the maintenance margin in the token contract.
- The governor can update the token premium position fee in the contract.
- The governor can update the utils contract address.

- The governor can update the new governor in the contract.
- The governor can disable trading activity.
- The governor can disable LP activity.
- The governor can update the order manager's contract address.
- The governor can update the USDL contract address.
- The governor can add the OI Balance threshold to the contract.
- The governor can update the liquidator in the contract.
- The governor can update the maximum gas price.
- The governor can update the price fees contract address.
- The governor can update the pool safety factor in BPS.
- The governor can update the maximum leverage.
- The governor can update the max global short size, global short limit, long size limit, and long size BPS.
- The governor can update the mint fee basis point, margin fees basis point, liquidation fee in USD, liquidator factor, and minimum profit time.
- The governor can update the borrowing and funding rates.
- The governor can update the token configuration.
- The governor can withdraw fees from the contract.
- The governor can update the governor's address.
- The governor can update the name and symbol of the contract.
- The governor can add/remove admins from the contract.
- The governor can withdraw tokens and send them to the wallets.
- The owner can enable/disable whitelist mode.
- The governor can update the whitelist handler in the contract.
- The admin can add/remove the non-staking account.
- The governor can update the governor's address.
- The governor can update the name and symbol of the contract.
- The governor can add/remove admins from the

## **YieldToken**

## **BaseToken**

contract.

- The governor can withdraw tokens and send them to the wallets.
- The governor can enable/disable private transfer mode.
- The governor can add/remove the handler in the contract.
- The governor can add/remove minters in the contract.
- The minter can mint an unlimited number of tokens to any arbitrary address.
- The minter can burn tokens from other wallets without any allowance.

## Recommendations

To avoid potential hacking risks, it is advisable for the client to manage the private key of the privileged account with care. Additionally, we recommend enhancing the security practices of centralized privileges or roles in the protocol through a decentralized mechanism or smart-contract-based accounts, such as multi-signature wallets.

Here are some suggestions of what the client can do:

- Consider using multi-signature wallets: Multi-signature wallets require multiple parties to sign off on a transaction before it can be executed, providing an extra layer of security e.g. Gnosis Safe
- Use of a timelock at least with a latency of e.g. 48-72 hours for awareness of privileged operations
- Introduce a DAO/Governance/Voting module to increase transparency and user involvement
- Consider Renouncing the ownership so that the owner cannot modify any state variables of the contract anymore. Make sure to set up everything before renouncing.

# Audit Result

## Critical Issues

No critical issues

## High Issues

### #1 | The admin can lock trading and liquidation activity.

File	Severity	Location	Status
Timelock.sol	High	L56-58	ACK

**Description** – The contract contains functionality in which the contract's admin can cease trading and liquidation activity in the vault contract for an indefinite period of time. This is not recommended as it can lock the contract permanently, and there is no time limit in which the trading and liquidity activity will auto-enable. There must be functionality in which the trading and liquidation activity cannot be locked up indefinitely.

### #2 | The Manager can lock the selling of USDL.

File	Severity	Location	Status
Vault.sol	High	L459-483	ACK

**Description** – The manager of the contract can lock the selling of USDL tokens for an indefinite period of time which is not recommended as this can cause the lock of funds. There must be a check so that the tokens should not get locked permanently in the contract.

## Medium Issue

---

**#1 | The owner can set fees of more than 25%.**

File	Severity	Location	Status
BaseOrderManager.sol	Medium	L56-58	ACK
RewardRouter.sol	Medium	L70-72	ACK
Vault.sol	Medium	L296-314	ACK

**Description** – The contract contains functionality in which the governor can update the fees to more than 100% which is not recommended as there should not be any fees in the contract that can be more than 25% in the contract.

**#2 | Missing 'isContract' check.**

File	Severity	Location	Status
BaseOrderManager.sol	Medium	L44-54	Fixed
LLPManager.sol	Medium	L72-74, L97-107	Fixed
PriceFeed.sol	Medium	L54-60	Fixed
PythPriceFeed.sol	Medium	L59-65, L75-77	Fixed
ReaderCache.sol	Medium	L27-45	Fixed
ReaderContract.sol	Medium	L75-85	Fixed
RewardRouter.sol	Medium	L58-68	Fixed
USDL.sol	Medium	L20-22	Fixed
Utils.sol	Medium	L94-104	Fixed
Vault.sol	Medium	L188-191, L208-216, L260-263	Fixed

**Description** – The contract contains the functionality in which the owner can set any arbitrary address in the place of the contract address, as this can lock the functionalities if the owner has set any arbitrary address in the place of the contract address.

**Remediation** – Add a 'require' check that the address can only be set to the contract address.

### #3 | Missing Threshold.

File	Severity	Location	Status
LLPManger.sol	Medium	L88-90	ACK
OrderManager.sol	Medium	L226-229, L236-238, L240-254, L260-268	ACK
PriceFeed.sol	Medium	L70-80	ACK
ReaderContract.sol	Medium	L35-73	ACK
RewardRouter.sol	Medium	L66-72	ACK
RewardTracker.sol	Medium	L73-75, L81-83	ACK
Utils.sol	Medium	L58-92, L110-120	ACK

**Description** – The governor can update any arbitrary amount in the value, including zero, as this can fail the functionalities in the contract if the value is set to zero. There must be a check so that the value in the contract cannot be set to zero to avoid these circumstances in the contract.

### Low Issue

---

### #1 | Missing events

File	Severity	Location	Status
BaseOrderManager.sol	Low	L44-46, L48-50, L52-54, L56-58	ACK
LLPManager.sol	Low	L72-86, L88-90, L92-95, L97-107	ACK
OrderManager.sol	Low	L226-229, L236-238, L240-254	ACK
Pricefeed.sol	Low	L59-65, L75-77, L62-68, L70-80	ACK
PythPriceFeed	Low	L59-65, L75-77, L79-85	ACK
ReaderCache.sol	Low	L27-45	ACK
ReaderContract.sol	Low	L35-73, L75-85	ACK
RewardRouter.sol	Low	L58-68	ACK
RewardTracker.sol	Low	L73-75, L81-83	ACK
Timelock.sol	Low	L84-151, L175-194	ACK
Vault.sol	Low	--	ACK

Utils.sol	Low	--	ACK
YieldToken.sol	Low	L48-63, L70-88	ACK
BaseToken.sol	Low	L47-62, L69-75	ACK

**Description** – It is recommended that all the critical parameter changes in the contract be emitted.

## #2 | Floating pragma solidity version.

File	Severity	Location	Status
BaseOrderManager.sol	Low	L3	Fixed

**Description** – Adding the constant version of solidity is recommended, as this prevents the unintentional deployment of a contract with an outdated compiler that contains unresolved bugs.

## #3 | Missing visibility

File	Severity	Location	Status
OrderManager.sol	Low	L26	Fixed
RewardTracker.sol	Low	L40	Fixed

**Description** – It is recommended to add ‘public’, ‘private’, or ‘internal’ visibility while declaring or initializing a state variable or a mapping in the contract.

## #4 | Missing zero or dead address check.

File	Severity	Location	Status
PriceFeed.sol	Low	L62-68	Fixed
RewardRouter.sol	Low	L74-76	Fixed
RewardTracker.sol	Low	L69-71, L77-79	Fixed
TierBasedTradingFees.sol	Low	L17-19, L21-23	Fixed
Timelock.sol	Low	L84-99, L210-212	Fixed

Vault.sol	Low	L193-196	Fixed
YieldToken.sol	Low	L48-50, L57-63	Fixed
BaseToken.sol	Low	L47-62, L73-75	Fixed
MintableBaseToken.sol	Low	L20-22	Fixed

**Description** – It is recommended to check that the address cannot be set to zero or dead address.

## #5 | Unused function parameter.

File	Severity	Location	Status
RewardRouter.sol	Low	L293-300	ACK

**Description** – It is recommended that the unused parameter be removed from the functions in the contract.

## Informational Issue

---

### #1 | NatSpec Documentation missing.

File	Severity	Location	Status
All	Informational	--	ACK

**Description** – If you started to comment on your code, also comment on all other functions, variables, etc.

### #2 | Contract doesn't import packages from source (like OpenZeppelin etc.)

File	Severity	Location	Status
All	Informational	--	ACK

**Description** – We recommend to import all packages from npm directly without flattening the contract. Functions could be modified or can be susceptible to vulnerabilities.

## Legend for the Issue Status

Attribute or Symbol	Meaning
<b>Open</b>	The issue is not fixed by the project team.
<b>Fixed</b>	The issue is fixed by the project team.
<b>Acknowledged(ACK)</b>	The issue has been acknowledged or declared as part of business logic.
