Introduction

SolidProof.io is a brand of the officially registered company FutureVisions Deutschland, based in Germany. We're mainly focused on Blockchain Security such as Smart Contract Audits and KYC verification for project teams.

Solidproof.io assess potential security issues in the smart contracts implementations, review for potential inconsistencies between the code base and the whitepaper/documentation, and provide suggestions for improvement.

Disclaimer

SolidProof.io reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of the security or functionality of the technology we agree to analyze.

Project Overview

Summary

Project Name	Goku City
Website	https://gokucity.com/
About the project	Gokucity is an innovative crypto platform that revolutionizes user engagement and token distribution in the DeFi space by combining the excitement of Lootballz with a sustainable token economy. The platform addresses the challenges faced by many DeFi projects, such as short-term participation and long-term instability, by introducing a gamified approach to token distribution that keeps users engaged and incentivized.
Chain	Seitrace
Language	Solidity
Codebase	https://seitrace.com/address/0xF8ba17BB0e420117dd63B35282d24513261f1cA0?chain=pacific-1&tab=contract

Audit Summary

Version	Delivery Date	Change Log
v1.0	26. June 2024	<ul style="list-style-type: none">· Layout Project· Automated/ Manual-Security Testing· Summary
v1.1	01. July 2024	<ul style="list-style-type: none">· Reaudit

Note – The following audit report presents a comprehensive security analysis of the smart contract utilized in the project that includes outside manipulation of the contract's functions in a malicious way. This analysis did not include functional testing (or unit testing) of the contract/s logic. We cannot guarantee 100% logical correctness of the contract as we did not functionally test it. This includes internal calculations in the formulae used in the contract.

File Overview

The Team provided us with the files that should be tested in the security assessment. This audit covered the following files listed below with an SHA-1 Hash.

N/A

Please note: Files with a different hash value than in this table have been modified after the security check, either intentionally or unintentionally. A different hash value may (but need not) be an indication of a changed state or potential vulnerability that was not the subject of this scan.

Imported packages.

Used code from other Frameworks/Smart Contracts.

N/A

Note for Investors: We only audited contracts mentioned in the scope above. All contracts related to the project apart from that are not a part of the audit, and we cannot comment on its security and are not responsible for it in any way.

External/Public functions

External/public functions are functions that can be called from outside of a contract, i.e., they can be accessed by other contracts or external accounts on the blockchain. These functions are specified using the function declaration's external or public visibility modifier.

State variables

State variables are variables that are stored on the blockchain as part of the contract's state. They are declared at the contract level and can be accessed and modified by any function within the contract. State variables can be needed within visibility modifier, such as public, private or internal, which determines the access level of the variable.

Components

 Contracts	 Libraries	 Interfaces	 Abstract
1	0	4	0

Exposed Functions

This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.

 Public	 Payable			
36	1			
External	Internal	Private	Pure	View
35	34	0	1	15

StateVariables

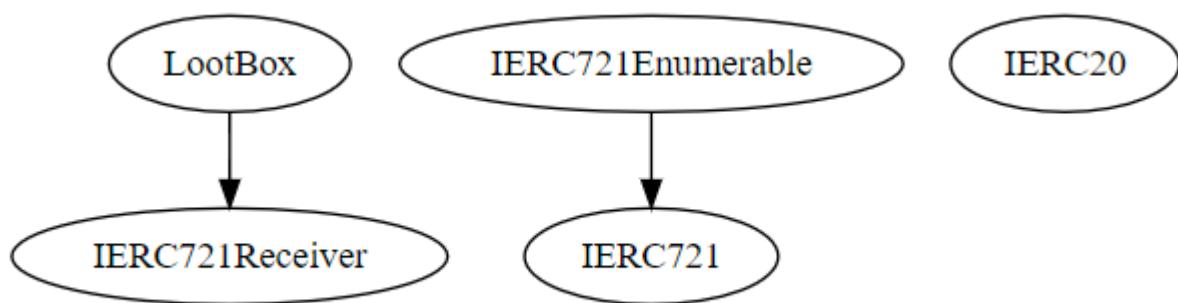

Total	 Public
22	21

Capabilities

Solidity Versions observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts	
^0.8.20	-----	Yes		-----	
Transfer s ETH	Low-Level Calls	Delegate Call	Uses Hash Functions	ECRecover	New/Create/Create2
yes					

Inheritance Graph

An inheritance graph is a graphical representation of the inheritance hierarchy among contracts. In object-oriented programming, inheritance is a mechanism that allows one class (or contract, in the case of Solidity) to inherit properties and methods from another class. It shows the relationships between different contracts and how they are related to each other through inheritance.

Audit Information

Vulnerability & Risk Level

Risk represents the probability that a certain source threat will exploit the vulnerability and the impact of that event on the organization or system. The risk level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 - 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
Medium	4 - 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 - 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 - 1.9	A vulnerability that has informational character but is not affecting any of the code.	An observation that does not determine a level of risk

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to check the repository for security-related issues, code quality, and compliance with specifications and best practices. To this end, our team of experienced pen-testers and smart contract developers reviewed the code line by line and documented any issues discovered.

We check every file manually. We use automated tools only so that they help us achieve faster and better results.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
 - a. Reviewing the specifications, sources, and instructions provided to SolidProof to ensure we understand the size, scope, and functionality of the smart contract.
 - b. Manual review of the code, i.e., reading the source code line by line to identify potential vulnerabilities.
 - c. Comparison to the specification, i.e., verifying that the code does what is described in the specifications, sources, and instructions provided to SolidProof.
2. Testing and automated analysis that includes the following:
 - a. Test coverage analysis determines whether test cases cover code and how much code is executed when those test cases are executed.
 - b. Symbolic execution, which is analysing a program to determine what inputs cause each part of a program to execute.
3. Review best practices, i.e., review smart contracts to improve efficiency, effectiveness, clarity, maintainability, security, and control based on best practices, recommendations, and research from industry and academia.
4. Concrete, itemized and actionable recommendations to help you secure your smart contracts.

Overall Security Upgradeability

Contract is not an upgradable	 Deployer cannot update the contract with new functionalities.
Description	The contract is not an upgradeable contract. The Deployer is not able to change or add any functionalities to the contract after deploying.
Comment	N/A

Ownership

Contract ownership is not renounced.

 The ownership is not renounced.

Description

The owner has not renounced the ownership that means that the owner retains control over the contract's operations, including the ability to execute functions that may impact the contract's users or stakeholders. This can lead to several potential issues, including:

- Centralizations
- The owner has significant control over contract's operations.

Comment

N/A

Note – *The contract cannot be considered as renounced till it is not deployed or having some functionality that can change the state of the contract.*

Ownership Privileges

These functions can be dangerous. Please note that abuse can lead to financial loss. We have a guide where you can learn more about these Functions.

Minting tokens

Minting tokens refer to the process of creating new tokens in a cryptocurrency or blockchain network. This process is typically performed by the project's owner or designated authority, who has the ability to add new tokens to the network's total supply.

Contract owner cannot mint new tokens.

 **The owner cannot mint new tokens.**

Description	The owner is not able to mint new tokens once the contract is deployed.
Comment	N/A

Burning tokens

Burning tokens is the process of permanently destroying a certain number of tokens, reducing the total supply of a cryptocurrency or token. This is usually done to increase the value of the remaining tokens, as the reduced supply can create scarcity and potentially drive up demand.

Contract owner cannot burn tokens	 The owner cannot burn tokens.
Description	The owner is not able burn tokens without any allowances.
Comment	N/A

Blacklist addresses

Blacklisting addresses in smart contracts is the process of adding a certain address to a blacklist, effectively preventing them from accessing or participating in certain functionalities or transactions within the contract. This can be useful in preventing fraudulent or malicious activities, such as hacking attempts or money laundering.

Contract owner cannot blacklist addresses.

 **The owner cannot blacklist wallets.**

Description	The owner cannot blacklist wallets from transferring of tokens.
Comment	N/A

Fees and Tax

In some smart contracts, the owner or creator of the contract can set fees for certain actions or operations within the contract. These fees can be used to cover the cost of running the contract, such as paying for gas fees or compensating the contract's owner for their time and effort in developing and maintaining the contract.

Contract owner cannot set fees more than 25%.

The owner cannot set fees more than 25%.

Description	The owner cannot set fees of more than 25%.
Comment	N/A

Lock User Funds

In a smart contract, locking refers to the process of restricting access to certain tokens or assets for a specified period of time. When token or assets are locked in a smart contract, they cannot be transferred or used until the lock-up period has expired or certain conditions have been met.

Contract owner can lock function.

 The owner can lock function.

Description	The owner can lock the contract.
Comment	The contract contains the functionality in which the day left will only be decreased when the owner updates the reward amount. This can cause the lock of funds for an indefinite period of time as if the owner does update the reward amount daily then the day count will not be decreased. There must be functionality in which the day left period should automatically work after the launch.

Centralization Privileges

Centralization can arise when one or more parties have privileged access or control over the contract's functionality, data, or decision-making. This can occur, for example, if the contract is controlled by a single entity or if certain participants have special permissions or abilities that others do not.

In the project, there are authorities that have access to the following functions:

File	Privileges
LootBox.sol	<ul style="list-style-type: none">➤ The owner can start the reward period in the contract.➤ The owner can set any arbitrary amount as the reward amount in the contract, including zero.➤ The owner can set any arbitrary amount as the Goku price in USDT, SEI.➤ The owner can update the USDT token address in the contract.➤ The owner can set any arbitrary address as the team wallet address, including zero.➤ The owner can update the NFT contract address.➤ The owner can set the reward amount for the recipient to any arbitrary amount including zero.➤ The owner can update the reward amount in the contract.➤ The owner can withdraw all rewards from the contract.➤ The owner can withdraw USDT and SEI from the contract.➤ The owner can withdraw NFT from the recipient's wallet.

Recommendations

To avoid potential hacking risks, it is advisable for the client to manage the private key of the privileged account with care. Additionally, we recommend enhancing the security practices of centralized privileges or roles in the protocol through a decentralized mechanism or smart-contract-based accounts, such as multi-signature wallets.

Here are some suggestions of what the client can do:

- Consider using multi-signature wallets: Multi-signature wallets require multiple parties to sign off on a transaction before it can be executed, providing an extra layer of security e.g. Gnosis Safe
- Use of a timelock at least with a latency of e.g. 48-72 hours for awareness of privileged operations

- Introduce a DAO/Governance/Voting module to increase transparency and user involvement
- Consider Renouncing the ownership so that the owner cannot modify any state variables of the contract anymore. Make sure to set up everything before renouncing.

Audit Result

Critical Issues

No critical issues

High Issues

No high issues

Medium Issue

#1 | The owner can set reward to zero.

File	Severity	Location	Status
LootBox.sol	Medium	L97-103	ACK

Description – The owner can set any arbitrary value as the reward for the recipient including zero. As the user has transferred the tokens in the contract it is recommended that there must be a reward functionality so that the rewards can be added to the user automatically.

#2 | The owner can update the stable coin contract address.

File	Severity	Location	Status
LootBox.sol	Medium	L82-84	ACK

Description – The owner can update any arbitrary address as the USDT stablecoin address including zero which is not recommended as if the address is set to any arbitrary address the functionality will fail in the contract. It is recommended that the stablecoin address should be immutable in the contract to avoid these circumstances.

#3 | Inoperative time functionality.

File	Severity	Location	Status
LootBox.sol	Medium	L82-84	ACK

Description – The contract contains the functionality in which the day left will only be decreased when the owner updates the reward amount. This can cause the lock of funds for an indefinite period of time as if the owner

does update the reward amount daily then the day count will not be decreased. There must be functionality in which the day left period should automatically work after the launch.

Low Issue

#1 | Floating pragma solidity version.

File	Severity	Location	Status
All	Low	L2	ACK

Description – Adding the constant version of solidity is recommended, as this prevents the unintentional deployment of a contract with an outdated compiler that contains unresolved bugs.

#2 | Missing zero or dead address check.

File	Severity	Location	Status
LootBox.sol	Low	L82-84, L87-89, L92-94	ACK

Description – It is recommended to check that the address cannot be set to zero or a dead address.

#3 | Missing events arithmetic.

File	Severity	Location	Status
LootBox.sol	Low	L58-66, L82-84, L87-89, L92-94, L68-70, L72-74, L77-79, L97-103, L249-254	ACK

Description – Emit all the critical parameter changes.

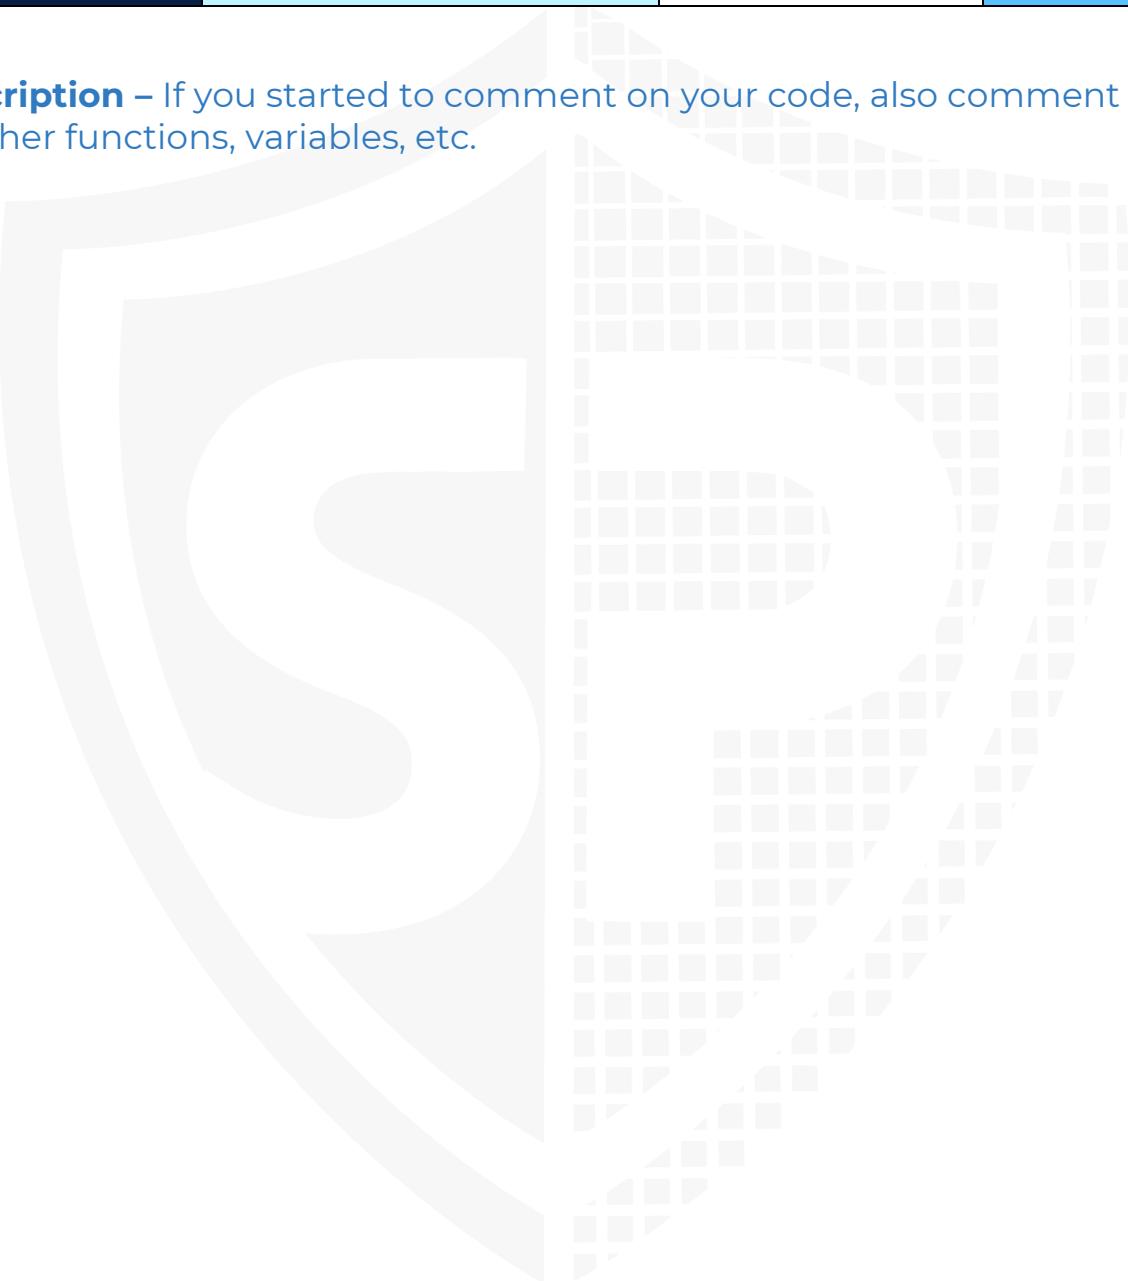

Informational Issue

#1 | NatSpec Documentation missing.

File	Severity	Location	Status
All	Informational	--	ACK

Description – If you started to comment on your code, also comment on all other functions, variables, etc.

Legend for the Issue Status

Attribute or Symbol	Meaning
Open	The issue is not fixed by the project team.
Fixed	The issue is fixed by the project team.
Acknowledged(ACK)	The issue has been acknowledged or declared as part of business logic.
